

Interoperability

Interoperability is about painless communication between Novapoint and other systems. This mainly means the possibility to import data from all relevant sources to the Quadri model, and then export back again. It also means to be able to view data from relevant sources - together with the Quadri model. Example of this is Web Map Services support (WMS), ortho photo support, massive point clouds support. All these sources can be viewed together with the Quadri model, without importing it (point clouds can also be imported).

This section documents the details of how interoperable Novapoint is with regard to the different formats supported. The actual import process is covered [here](#).
