

Model activity status is Processing in QMM

In the Models-tab in QMM, the Activity column has two possible values: **Idle** and **Processing**.

The activity status is **Processing** if a server operation like Share, Receive, Reserve etc. is going on. If there is no server operation going on, the status is **Idle**.

*Sometimes a server operation is within a transaction that is never resumed by the client. In this case the server waits for 24 hours before killing the process. In the meantime the activity status is **Processing**.*
