

Updates in Novapoint Tunnel

The values for straight walls given for the perimeter, are now stored the first time you save the values.

To be able to store these new values for an existing project, you must first update the feature catalogue version, that is FC 1926 (1.18). For a server project, you must do this upgrade of the FC on the server with Quadri Model Manager. For a local project, you must first make a new project with the new FC and then do a QG4 import of the existing project into the new project.
